Marine Ecology Progress Series 388:169–184 (2009)

Table S1. Mean percentage fatty acid composition ( $\pm$ SE) of *Jasus edwardsii* and potential prey items for fished and reserve treatments. As general linear models showed no significant differences between Maria and Governor Island bioregions (except for brown algae), fatty acid values have been pooled across bioregions for each species. SFA: saturated fatty acids; MUFA: monounsaturated fatty acids; PUFA: polyunsaturated fatty acids. All double bonds are cis geometry unless otherwise indicated. Asterisks indicate those fatty acids whose identity could not be separated due to chromatographic overlap
