Abstract

This thesis documents the annual profiles of the primary reproductive steroids testosterone (T), 17 β -oestradiol (E2) and progesterone (P4), in the reproductive cycles of male and female blue-tongued lizards, *Tiliqua nigrolutea*. Data collected from a large captive population over three consecutive reproductive seasons are included. Reproductive cycles are discussed in the context of other viviparous squamate reptiles, while a broader comparative approach is used to consider patterns of steroid biosynthesis and peripheral metabolism.

The annual patterns of circulating concentrations of T, E2 and P4 have been characterised for both sexes. In males, peak plasma T ($10.9 \pm 3.00 \text{ ng ml}^{-1}$) and E2 ($778.0 \pm 120.00 \text{ pg ml}^{-1}$) concentrations occur coincident with late spermatogenesis and observations of mating, respectively. Plasma P4 concentrations remain basal ($< 1.2 \text{ ng ml}^{-1}$) throughout the annual reproductive cycle. In females, increasing plasma E2 concentrations ($275.2 \pm 33.87 \text{ pg ml}^{-1} - 715.1 \pm 106.68 \text{ pg ml}^{-1}$) are associated with vitellogenesis and plasma T peaks ($6.3 \pm 0.63 \text{ ng ml}^{-1}$) in the mating and peri-ovulatory period. In pregnant females, plasma P4 concentrations are elevated for the first two thirds of gestation, peaking in the second trimester at $12.7 \pm 1.27 \text{ ng ml}^{-1}$ and falling rapidly prior to parturition. Concurrently, plasma P4 concentrations in non-reproductively active adult females remain basal ($1 - 2 \text{ ng ml}^{-1}$) throughout the year.

There is good circumstantial evidence for a multiennial reproductive cycle in females. Parturition occurs late in the active season, presumably leaving little time for females to store sufficient fat reserves to become vitellogenic in the following spring: reproductive opportunities are effectively missed in at least one year following a reproductive effort. Observed reproductive behaviours, including agonistic male – male interactions, mating, and parturition, are documented.

An investigation of gonadal steroid biosynthetic pathways in this viviparous squamate is presented. This compares variation in the relative contributions of the delta-4 and delta-5 steroidogenic pathways according to sex and reproductive condition. The delta-4 pathway

predominates in both sexes, aligning this species phylogenetically with other reptiles. However, there are clear differences between sexes and with changing reproductive condition in the patterns of production of pathway intermediates and end-products. Additionally, detection of a possibly novel polar steroid as a major end-product of steroid biosynthesis in both sexes is reported.

Peripheral (extragonadal) metabolism of T and E2 in a number of reproductively relevant steroid target tissues is compared at times of year chosen to represent three clearly distinctive reproductive conditions in each sex. There are differences both between sexes, between tissue types and with changing reproductive condition in the relative proportions of steroid conjugates and non-conjugated derivatives produced. Biosynthetic pathway activity and peripheral steroid metabolism both appear to be plastic in response to changing reproductive condition in *Tiliqua nigrolutea*.

With a comprehensive database of information about the reproductive endocrinology and physiology of *Tiliqua nigrolutea*, this species is now available as a model to further examine selected aspects of the steroid hormone control of reproductive physiology and behaviour in a cool temperate, viviparous reptile.

Ethics permits

This project was conducted with the approval of the University of Tasmania animal ethics committee under ethics permit numbers 95046 and 98015.

No permit or licence is required in Tasmania to collect (with the exception of collection from national parks) or keep reptiles.

Acknowledgments

First, I must thank **Sue Jones**. What an amazing person my supervisor is! For treating me as friend, student and equal all in one, for all your support, faith and encouragement (and just the right amount of heavy-handedness!), thank you! You came all the way to Queensland to get me, and as soon as I heard you were a rattie sympathiser, I just knew we would get along! Thank you, also, for not using red pen – my self-esteem is so much the better for soothing colours, smiley faces, and let's not forget the gold star! (Why was there only one of those? – sigh!) I strongly advocate the chocolate reward system you initiated, and see no reason for it to stop now! For all the coffee and chats, project-related and otherwise, again, thank you! You have put such a lot of time and effort in to me - I couldn't have wished for a better role model.

Many thanks also go to **Roy Swain**. Here is a remarkably resilient man who has allowed me to make him look foolish almost continuously, and yet retains enormous self-confidence and a very silly grin! My hat off to you, Sir! I am definitely coming back for the retirement party! I always feel welcome in your office, except when you are doing the crossword! Thanks for all the help, advice, editing, support and entertainment! Do you know where your glasses are right now?

Thank you to my number one chief volunteer lizard holder and all round helper, **Fiona “they're my lizards too” Reardon** - never again will I ask you to do anything so smelly, no matter how much disinfectant there is! For all the stuff I couldn't do alone, for *trying* to keep me sane at home as well (can't win 'em all, hey?), for lizard caring above and beyond the call, thank you so much. I'm really sorry F14 bit you! Thanks for help with all those late night forays into peoples' gardens with a torch to hunt for snails in the rain. I'm still surprised no one ever called the police. There is no one with whom I would rather wrestle a lizard to the ground.

Special thanks go to **Noel Davies** for letting me be the guinea pig on the new HPLC, and for all your time, effort and help identifying steroids. Thanks also to **Joan Whittier** for the samples of oestrogens and to **Adrian Bradley** for the gifts of antisera for the RIAs.

Thanks to **Robert Mason** for advice and for volunteering the services of **Lew Pannell** in an attempt to identify a tricky steroid.

Thanks also to **Erik Wapstra** for talks and coffee, oh, and the messy lab. Thanks to **Julianne O'Reilly** for trying to make Erik less messy, and to both of you for reading thesis drafts in your tiny bits of spare time. I've tried not to hold the overseas trip and all the postcards against you, while I was back here, plodding along in the lab.

To **Brett Gartrell**, who turned out to be the best person for coffee breaks I have ever met! Thank you too, for all your support while I was writing up, for reading bits of thesis, all your help with Rattie, with my computer troubles (except the ones you were responsible for!), for company at lunch and generally propping me up at regular intervals!

To **Tamara Kincade**, thanks for heaps of help bleeding lizards, even if they were not as interesting as bats!

Thanks to all those people who ever caught me a lizard. There are so many of you who thought of me and wrestled lizards to the ground in the name of science! Special mentions to **Ineke Kasteel** for her efforts in the middle of the Midlands Highway, to **Robert Barbour** for regular contributions ranging from alive to sort-of-alive to dead, **Fiona Reardon** for the one that came flying through her classroom window and to Sue's dog **Hannah the blue-tongue-seeking hound**, who teamed up with various Joneses for a superior lizard-catching effort.

Thanks to **Warren, Sarah** and **Penny Jones**, for welcoming me that first Easter. I trust none of you will use the negatives to my detriment! You have all continued to help me feel so extremely "special" since I arrived in Tasmania. I actually think you are all pretty "special" yourselves!

To **Robert White**, thank you for working so hard on my scholarship, and of course, for all the snails – the lizards certainly appreciated them!

Thanks to everyone else who brought in snails for the lizards as well, especially **Di Moyle**, who donated them by the bucketful.

Thank you to all the technical staff in the School of Zoology, **Kate Hamilton, Sherrin Bowden, Wayne Kelly, Barry Rumbold, Richard Holmes, Adam Stephens, Alan Dumphy** and **Ron Mawbey** for all your help along the way.

Thanks to the people who tried to explain all that statistics stuff to me, **Roy Swain, Leon Barmuta, Craig Johnson, David Ratkowsky**, and **Alistair Richardson**. I feel like I won a war but was trampled on most of the battlefields.

Thank you to **Brita Hansen** who showed me all sorts of little tricks to make my life easier – computers can be fun after all! At least, it's possible to get them to do what you want some times!

To my mother, **Judi Edwards**, thank you for your support all the way through uni, nervous course change and all – I think it turned out to be the right decision! I will try not to come and live at home again. Thanks to my father, **Peter Edwards**. Having a car made winters in Tasmania almost bearable! To my brother, **Spencer Edwards**, I can't just think what you did to help, Spency, but thought I would mention you anyway.

And of course, special thanks to **Grant Davis**, alias Shag Nastie. For walks on the beach, for all those hot dinners, for letting me be stupid and hugging me anyway, thank you. I'm glad you decided to come along for the ride, and then so considerately stayed right out of the way! You're a bit good! In return, I promise to rapidly become extremely rich and support you so that you can quit work and play golf. I will feed you jelly beans and yellow snakes whenever your heart desires, and even massage your scurvy feet at night! Maybe.
